INSIGHTS

▲ Render blocking requests — Est savings of 600 ms

Requests are blocking the page's initial render, which may delay LCP. Deferring or inlining can move these network requests out of the critical path. (LCP) (FCP) (Unscored)

URL	Transfer Size	Duration
refilter.by (1st Party)	30.7 KiB	520 ms
/assets/index-n85Kue6.css (refilter.by)	30.7 KiB	520 ms

▲ Improve image delivery — Est savings of 5 KiB

Reducing the download time of images can improve the perceived load time of the page and LCP. Learn more about optimizing image size (LCP) (FCP) (Unscored)

URL	Resource Size	Est Savings
refilter.by (1st Party)	53.2 KiB	5.1 KiB
Современный автосервис Refilter 	53.2 KiB	5.1 KiB
Increasing the image compression factor could improve this image's download size.		5.1 KiB

▲ Forced reflow

A forced reflow occurs when JavaScript queries geometric properties (such as offsetWidth) after styles have been invalidated by a change to the DOM state. This can result in poor performance. Learn more about forced reflows and possible mitigations. (Unscored)

▲ Network dependency tree

Avoid chaining critical requests by reducing the length of chains, reducing the download size of resources, or deferring the download of unnecessary resources to improve page load. (LCP) (Unscored)

Maximum critical path latency: 1,814 ms

Preconnected origins

preconnect hints help the browser establish a connection earlier in the page load, saving time when the first request for that origin is made. The following are the origins that the page preconnected to.

no origins were preconnected

Preconnect candidates

Add preconnect hints to your most important origins, but try to use no more than 4.
